

## ABSTRACT

1  
2  
3 The apparatus of this invention includes a long rod and a short rod, each of  
4 desired length, and each with a rake on one end and a hoe on the other end. Both  
5 rakes are of the same novel construction with three tines uniquely arranged to  
6 enable a workman mounted on a ladder to pull leaves in a conventional gutter  
7 toward himself and beneath spikes holding the gutter to a roof. The method of this  
8 invention enables a workman to draw leaves toward himself from both sides of his  
9 ladder without having to move the ladder.
